Ol redmania- Aug 2006  
ol\_redmania

The same template in 4 different colors. Some of the features:

-Suckerfish drop-down menus do not use javascript to render the menu items but instead use pure CSS. This is vital to screen readers and robots alike and is compatible with all major browsers.

Installation of Suckerfish drop-down menus:

Suckerfish menus in Mambo and Joomla require a module called Extended Menu. Extended Menu (mod\_exmenu) is a stable module compatible with Mambo & Joomla. Install it as you would any other module. You can leave just of the default settings in tact but just a few changes are necessary. Make sure you do the following in the Extended Menu module parameters.

Download Extended Menu: mod\_exmenu\_1.0.3.zip

Instructions:

Install the module! (Site>Installers>Modules>::install the above file::

Go to Modules>Site Modules and find the Extended Menu you just installed.

- Set Show Title to No
- Set the Position to user 3
- Set Menu Name to mainmenu (or whichever you like)
- Set Published to Yes
- Set Menu Style to Flat List
- Set Expand Menu to Yes
- Click Save at the very top and your'e just about done!

Now, just to be sure there is nothing else published in the user 3 position, look over to the right in the module manager at the drop down that says select position. Click this and set it to user 3. You will see a filtered list of all your user 3 module positioned items. Click the red X to unpublish everything but the Extended Menu module or move them to another position in their respective parameters.

Now to get the dropdowns..

Go to Menu>mainmenu (or whichever menu name you assigned to the module previously). To make a menu item become a submenu (or dropdown) menu item you need to assign it to a parent item. You can either create new menu items from the New button above or click inside an existing menu item to assign it to a parent menu item. Just click on the item you wish to assign it to in the menu item parameters and you have successfully installed this module.

An overview of OI Bluemania key features:

- Mambo 4.5.2.X compatible
  - Joomla 1.0x+ compatible
  - All module positions are fully collapsable
  - 13 Module positions!
